Milestone-1 Creation of Users and Roles

Main Project: Script-Controlled ACL – Restrict Record Access Based on Field Value

Overview

Create the users and roles required for the ServiceNow ACL project. Roles provide the basic authorization boundary, while the ACL script will later provide record-level access based on a field value.

Steps

- Open User Administration and create the required test users.
- Create application-specific roles such as x_project.employee and x_project.manager.
- Assign the employee role to normal test users and the manager role to users who need broader access.
- Keep an administrator account available for configuration and troubleshooting.
- Use impersonation to test the ACL behavior for different users.

Recommended test setup

- User A: employee role and Department A.
- User B: employee role and Department B.
- Manager: manager role with broader access.
- Administrator: configuration and troubleshooting access.

Expected result

Users with the appropriate role are able to reach the application, but their record access will still be controlled by the field-value ACLs created in later milestones.
