Milestone-2 Tables Creation

Main Project: Script-Controlled ACL – Restrict Record Access Based on Field Value

Overview

Create the custom table that contains the records to be protected by the ACL rules.

Suggested table fields

- u_name – String: record name or title.
- u_department – Choice or Reference: the field used by the ACL script.
- u_owner – Reference to User: record owner.
- u_description – String/HTML: additional information.
- u_active – True/False: optional status field.

Steps

- Create the custom application/table.
- Add the fields required by the project.
- Make u_department a controlled Choice or Reference field.
- Create sample records using at least two different department values.
- Verify that the table and records can be accessed by an administrator before applying the ACLs.

Design rule

The restricted field should contain a trusted value that can be compared with the logged-in user's permitted value. Avoid relying only on client-side form behavior for security.
