Milestone-3 Creation of Access Control List-READ

Main Project: Script-Controlled ACL – Restrict Record Access Based on Field Value

Overview

The READ ACL determines whether a user can view a record. In this project, access is allowed only when the record field value matches the user's permitted value.

ACL configuration

- Operation: read.
- Table: the custom table created in Milestone-2.
- Role: x_project.employee or the role defined for the project.
- Script: compare the record's restricted field with the logged-in user's permitted value.

Example script

```
answer = false;

if (gs.hasRole('x_project.employee')) {
    answer = current.u_department == gs.getUser().getDepartmentID();
}
```

Testing

- Matching department: READ should be allowed.
- Non-matching department: READ should be denied.
- Test multiple users with different department values.
- Use impersonation and ACL debugging to confirm the decision.

Expected result

A user can see only the records permitted by the field-value rule, while unauthorized records remain inaccessible.
