# Milestone-4 Creation of Access Control List-CREATE

Main Project: Script-Controlled ACL – Restrict Record Access Based on Field Value

## Overview

The CREATE ACL controls whether a user can create a new record. Because the record is new, the submitted field value must be validated.

## ACL configuration

- Operation: create.
- Table: the custom table.
- Role: the appropriate application role.
- Script: verify that the new record's restricted field belongs to the current user.

## Example script

```
answer = false;

if (gs.hasRole('x_project.employee')) {
    answer = current.u_department == gs.getUser().getDepartmentID();
}
```

## Testing

- Create a record with the user's permitted department: should succeed.
- Create a record using another department: should be denied.
- Try changing the form value before submission and verify server-side enforcement.
- Confirm that administrators/managers follow the intended exception policy.

## Expected result

A user cannot create records for a field value that is outside the user's permitted scope.
