Milestone-5 Creation of Access Control List-WRITE

Main Project: Script-Controlled ACL – Restrict Record Access Based on Field Value

Overview

The WRITE ACL controls modification of existing records. The existing record must satisfy the field-value restriction before an update is allowed.

Example script

```
answer = false;

if (gs.hasRole('x_project.employee')) {
    answer = current.u_department == gs.getUser().getDepartmentID();
}
```

Steps

- Create a WRITE ACL for the custom table.
- Assign the required application role.
- Check the current record's restricted field.
- Where required, also protect the restricted field with a field-level WRITE ACL.
- Test both permitted and non-permitted records.

Testing

- Modify a permitted record: update should succeed.
- Modify a non-permitted record: update should be denied.
- Attempt to change the restricted field to an unauthorized value.
- Verify administrator/manager behavior separately.

Expected result

Users can update only records that fall within their permitted field-value scope.
