Milestone-6 Creation of Access Control List-DELETE

Main Project: Script-Controlled ACL – Restrict Record Access Based on Field Value

Overview

The DELETE ACL controls whether a user can remove an existing record. Deletion should be restricted using the same field-value security rule or a stricter role-based rule.

Example script

```
answer = false;

if (gs.hasRole('x_project.employee')) {
    answer = current.u_department == gs.getUser().getDepartmentID();
}
```

Steps

- Create a DELETE ACL for the custom table.
- Assign the appropriate role.
- Validate the record's restricted field.
- Decide whether employees should be allowed to delete at all; in many systems deletion is limited to managers or administrators.
- Test deletion from both forms and list views.

Testing

- Permitted record: deletion should follow the project policy.
- Non-permitted record: deletion should be denied.
- Verify that hiding the Delete button is not being used as the only security control.
- Confirm that unauthorized server-side deletion is also blocked.

Expected result

A user cannot delete records outside the permitted scope.
